Sequence 17, Application US/09109207C
Patent No. 6172213
GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of Improving Polypept
FILE REFERENCE: P1123R1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19, Application US/09109207C

```
This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between apoptosis in cells with a normal system, by inhibiting binding between the apoptosis in cells with a normal system, by inhibiting binding between canti-inematic apoptosis in cells with a normal system, by inhibitic, antidiamatory, darmatological, immunosuppressive, thyromimetic, antidiateriosclerofic, cardiant and hepatropic activity. (I) induce antiarteriosclerofic, cardiant and hepatropic activity. (I) induce capoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic capoptosis by binding to cell surface Fas or inhibit it by competitive capoptosis by binding to cell surfaces, remained arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic versus host disease, Sjorgen's syndrome, coopeasture syndrome, Coopeasture, and Lingy, arterioscierosis, myocacidits, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody light chain construct designated Leu 2 hundring in the method of the invention.
                                                                                                                                                                      New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

Takahashi T; Serizawa N, Haruyama H, Nakahara K, Tamaki I,

WPI; 2000-258930/23. N-PSDB; AAA11631 New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

Claim 3; Page 156-157; 263pp; English.

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with a normal system, by inhibiting binding between the proposition of the invention have anti-inflammatory, anti-abletic, anti-allergic, anti-arthritic, anti-inflammatory, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antilhertility, neuroprotective, antirhenmatic, nephrotropic, antilhertility, inhibit it by competitive composition of ligand binding. (I) are used to treat and/or prevent inhibit and system, especially systemic ulpus exthematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Slorgem's syndrome, pernicious or hypoplastic anemia, Addison's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosolerosis, myocarditis, cardiomyopathy glomerulonephitis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They aligned, do not induce liver disease, and have reduced risk of the native ligand, do not induce liver disease, and praye induced in the contractive site of Fas, i.e. they minic the native ligand, and praye and prayers, and prayers and prayers. inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody light chain construct designated Leu 1 which is described in the method of the invention. This invention describes a novel humanized anti-Fas antibody-like

The products of the invention have anti-inflammatory, amuti-anticaphetic, anti-allergic, anti-arthritic, anti-inflammatory, anti-inflammatory, anti-inflammatory, anti-inflammatory, anti-inflammatory, anti-inflammatic, anti-inflammatory, anti-inflamm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in

upose erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-mas antibody light chain construct designated Leu 3 which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ő

This is the amino acid sequence or the PDHH type humanised light chain of murine anti-human Peas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAW83042) entailed making DIE, P47A, K49K; H805, P81R, V82L, B84P, A87F, T89V and R107K amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coll pishH5 SANK 70398 hazboxs plasmid pHSHF5 carrying a fusion fragment of the humanised PDHH type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Heshimoto's disease, clarenderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant ceptcion (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the amino acid sequence of the PDHH type humanised light
                                                                                                                                                                                                                                                                                                                                                                                                                                 Akio S, Hideyuki H, Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFFTA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephiritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AABI4777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                               murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardicomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody -

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
lupus errythematosus, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, Siorgen's syndrome, perntcious or hypoplastic
anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
disease, autoinmune hemolytic anemia, sterility, mysathenia gravis,
antiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
inhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they minic
the native ligand, do not induce liver disease, and have reduced risk of
munanised anti-Fas antibody HEFA designed light chain which is used in
the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

chain of murine anti-human Psayanne.

Chain of murine anti-human Psayanne.

Humanisation of the murine sequence (see AAW83042) entailed making party. W812, E84P, E85A, A87F and T89V amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coll pHsGHH7 SANK 73497 arbors plasmid pHsGHH7 carrying a fusion fragment of the human light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6073 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A apportosis in abnormal cells. The humanised antibodies special colls. The humanised antibodies in abnormal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve FasfFas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus errorm contractions and also to treat such diseases, and contractions and also to treat such diseases, including autoimmune disease getty expressions host disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sjögren syndrome, pernicious anaemia, Addison's disease, rscenterederna, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, anyocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the amino acid sequence of the HH type humanised light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidabetic, anti-alergic, anti-arthritic, antiviral, immunosuduatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerctic, cardiant and hepatropic activity. (I) induce antiarteriosclerctic, cardiant and hepatropic activity. (I) induce inhibition of ligand binding (C) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
                                                                                                                                                                                                                                                                                                                                                                             mimic
                                                                                                                                                                                                                           disease, autoimmune hemolytic anemna, sterility, mysthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocardis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, 1.e. they mind: the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-nurine antibody response. This sequence represents a humanised anti-Fas antibody HFR7A light chain HH type which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QQKPGQAPKLLIYAASNLESGVPSRFSGSGSGTDFTLTISSLQPEDFATYYCQQSNEDPR 120

New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS

Claim 21; Page 200; 292pp; English.

This is the amino acid sequence of the HM type humanised light chain of murine anti-human Fas monoclonal antibody HFETA.

Humanisation of the murine sequence (see AAM83042) entailed making P47A and K49R amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell E. coli pHSGHM17 SANK 73957 harbors plasmid pHSGHM17 carrying a fusion fragment of the humanised HM type HFETA light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6072 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFETA (see AAW8301-37), like native HFETA, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lugus erythematosus, Hashimoto's disease, cleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, atopy, arteriosclerosis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant celection (all claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (complementarity determining regions) to antibody HEFA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, applementations plantic anamana (pannyalophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and ABB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE/A, or a humanised version of HFE/A containing identical CDRs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains \frac{1}{2} \int_{-\infty}^{\infty} \frac{1}{2} \int

motherite (1) frate, induces apperents in certs with abnormal rasyras.

Ingand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-alergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antiarteriosclerotic, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (1) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, pernicious or hypoplastic userius host disease, Sjorgen's syndrome, pernicious or hypoplastic canemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral inhibit, apoptosis in normal cells but selectively induce it in abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HEFAA light chain HM type which is used in the method described in the invention.
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           QOKPGQAPKLLIYAASNLESGVPSRFSGSGSGTDFTLTISSLQPEDFATYYCQQSNEDPR 120

This is the amino acid sequence of the PDHM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAM83042) entailed making DIE, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chiain. Host call Escherichia coli pHSHMZ SANK 70198 harbors plasmid pHSHMZ Carrying a fusion of the humanised PDHM type HFE7A light chain and is methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells methods for inducing apoptosis in abnormal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lugus erythematosus, Hashimoto's disease, cleases, scleases, sclease, scleases, sclease, scleases, scleases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

capoptosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,

canti-memic, antidiabetic, anti-arthitic, antiviral,

immunomodulatory, dermatological, immunosuppressive, thyromimetic,

antistremiosclerotic, cardiant and hepatropic activity. (I) induce

capoptosis by binding to cell surface Fas or inhibit it by competitive

inhibition of ligand binding. (I) are used to treat and/or prevent

calseases associated with the Fas/Fas ligand system, especially systemic

clupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft

versus host disease, Slorgem's syndrome, pernicious or hypoplastic

cuenta, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's

disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,

cardiomyopathy, glomerulonephritis, hepatlitis (fulminant, chronic, viral

(B, C or D) or alcoholic), and transplant rejection. (I) selectively

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human anti-murine antibody response. This sequence represents

a humanised anti-reas antibody HeFAA designed light chain which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QQKPGQAPKLLIYAASNLESGVPSRFSGSGSGTDFTLTISSLQPEDFATYYCQQSNEDPR 120
